R. H. F. Hunter : Physiology of the Graafian Follicle and Ovulation before purchasing it in order to gage whether or not it would be worth my time, and all praised Physiology of the Graafian Follicle and Ovulation:

Ovulation is a key event in the female mammalian reproductive cycle, yet the process of ovulation itself remains poorly understood. Much of our knowledge comes from studies of laboratory rodents or domestic farm animals, with

more recent human studies focusing on problems of fertility or in vitro fertilization. This volume integrates the vast available literature from both animal and human systems to provide a comprehensive summary highlighting the key role played by the oocytes in all stages of ovulation.

"...a superb review of more than 100 years of descriptive, experimental, and clinical literature...an essential book for biological and medical libraries and for anyone interested in the physiology of reproduction." American Journal of Human Biology
