Childhood Disorders: Crucial Data That Could Save Your Child's Life:

1 of 1 people found the following review helpful. Excellent referenceBy CATURNExcellent book - a must read for all
parents of newborns!! The truth is out there -- there are also plenty of medical journals indicating problems with

vaccines (from autoimmune diseases, diabetes, neurologic problems, deaths, etc), the media just doesn't publicize anything. Go with your gut - don't let any doctor bully you into doing something that may do more harm than good to your child. 1 of 1 people found the following review helpful. Pretty much the same information

This book was a little disappointing to me. I have so many vaccine books, including one by the same author, which is great, but this one pretty much had the same information as the other books I have. It does go into autism a little more. If you are just beginning to investigate the risks of vaccines, or want more information on autism, than this is a good book to read. If you are well into your research, I wouldn't waste your money. 1 of 1 people found the following review helpful. Mainly about the MMR shot. If that's what you're looking for, this is it!!

I read any book on this topic, and while I learned a lot about the MMR shot, I didn't learn much about the others. It's all about the MMR shot. I would've liked to see a little more about the other vaccines.

Autism is a complex disability resulting in brain damage, immune dysfunction, self-destructive behavior patterns, and unresponsiveness to other people. Recently, autism rates (and other childhood disorders) have skyrocketed. These increases closely parallel the growing number of mandatory vaccines. In some regions, 1 of every 150 children is now autistic. We have a national and potentially worldwide epidemic on our hands. Autism often strikes following an early childhood of apparently normal development. Many parents believe that childhood vaccines, especially MMR (measles, mumps and rubella), are responsible. Some studies confirm that vaccines may cause autism in certain predisposed children. However, health authorities deny that autism is linked to vaccines. Some studies support their position. Congress recently held several hearings to investigate the causes of, and cures for, this growing epidemic. The testimony hints at a medical coverup. This book chronicles Congressional efforts to expose the truth, summarizes vaccine studies on both sides of the debate, and provides parents with crucial data to make informed decisions.

"After reading this book, parents will be better educated on the subject and their consent will then be truly informed." -- F. Edward Yazbak, MD, FAAP, Pediatrician, Autism Researcher
"Neil Miller has once again provided us with an extraordinarily well-documented and important book." -- Bernard Rimland, PhD, Director, Autism Research Institute
From the Publisher
Is Measles dangerous? Mumps? Rubella? Do vaccines still contain toxic mercury? Find out in this extremely well-researched and well-documented exposé. This comprehensive book includes 28 charts and graphs plus more than 500 references. As a concerned parent, you may now make informed, responsible decisions regarding the benefits and risks of vaccinating your child.
From the Author
When my first child was born, I researched vaccines and discovered that they are often unsafe and ineffective. I documented my findings in "Vaccines: Are They Really Safe and Effective?" so that other parents would be able to make more informed decisions regarding this controversial subject. Today, new studies validate my early warnings. For example, the prestigious medical journal, *Lancet*, published a landmark study by Dr. Andrew Wakefield linking the MMR vaccine to bowel inflammation and "developmental regression to autism." In addition, several congressional hearings were held to determine why autism rates have soared. In some parts of the country 1 of every 150 children is now autistic. My goal in writing this book is twofold: 1) to offer parents substantial evidence of MMR vaccine safety and efficacy defects information that they are unlikely to hear from their doctors so that truly informed decisions may be made; and 2) to chronicle MMR studies, congressional efforts to initiate positive change, and the continuing denials and coverups by vaccine proponents within the medical industry. I am opposed to bogus "proofs" of vaccine safety (such as studies funded by vaccine manufacturers), health mandates (forced immunizations), and other coercive tactics used to intimidate wavering parents. Thousands of children have already been hurt by MMR and other vaccines. Generations are falling victim to medical "progress." Regardless, autism and other developmental disorders are not childhood rites of passage. By mustering our collective outrage at this current state of affairs, shifts in consciousness and practices can occur.
